

Claims Update – Validation / Field Edit Report Warnings
October 15, 2008

As the Health Safety Net (HSN) moves forward towards functional claims adjudication it is necessary to maintain reporting of items that do not necessarily fail a claim, but may be useful for the provider to update in their system when possible, to maintain HSN Billing Regulations. This reporting, identified as Warnings on the Validation Report (Field Edit Report), most often defines missing medical data, modifiers, non-covered mixed with covered procedures and/or non-covered diagnoses and procedures appearing in a secondary position to a covered primary diagnosis or procedure.

Many times the Warnings are a reminder that something needs to be adjusted in the providers' systems but the Warnings may also report a grouping or pricing non-fatal error if a data element was not reported back through the application. Since these data elements define both analytical and reimbursement information, it is prudent to review them for any necessary changes.

Other Warnings are due to the transition of UCP to HSN and the data elements that may not have any bearing on either analysis or reimbursement. Please bear with us as we update the system and refine these particular Warnings to either provide valuable data for the provider or have them reviewed for removal.

Your continued feedback is both welcome and necessary during this phase of HSN development. Please contact the Division's claims customer support center at (866) 697-6080 with any questions regarding this claim update.
